on the eruptive states of  
Fever

Nat. l. Small pox 1  
Vaccination second 1  
Measles 14  
Erysipelas 14  
Miliary fever 20  
Unthan pox 20  
Purpura 21.  
Ere 21.

1  
As the small pox in the natural way has  
revived in our Country owing to the unfortunate  
prejudices against Vaccination in the people, and  
the unwillingness or refusal of physicians to in-  
-cubate, I shall deliver a few remarks upon its  
treatment derived from my own Observations.

1 It is most commonly a malignant, or <sup>a</sup> synocha  
fever.

2 During the eruptive fever, copious V.S. but ~~not~~  
this is forbidden, among Vounts & surgeons by ~~before~~  
reducing the fever before the eruption, & the danger  
of the disease. In this way I think I formerly  
saved many ~~life~~ lives. —

3 Cool or Cold Air should be used according to the  
form of the fever & State of the skin.

4 Great advantages arise in malignant cases  
from the exhibition of  $\mathcal{Q}$  so as to salivate at the  
turn of the pox. <sup>of the disease</sup>

5 V.S. should be used in the height or turn of the  
pox. Angina & pneumonia often take  
place at that time. The blood is tinged.  
I lately used it to miss Mitchell 1808.

There was a time once when the name  
of the small pox inspired as much terror  
than pestilence - famine and earthquakes, ~~and~~  
~~as the~~ war, fire, ~~or~~ ~~as~~ earthquakes, ~~and~~  
and with reason, for more of the human  
race have been destroyed by it by any one  
of them, or perhaps by all of them put  
together. War has its intervals of peace,  
famine is often preceded & followed by years  
of plenty & fire, <sup>earthquakes are</sup> ~~is~~ ~~as~~ ~~destructive~~ ~~to~~  
~~human life, and earthquakes occur so~~  
~~often as~~ extremely limited in their  
destructive effects upon human life.  
Even pestilence itself is a less evil  
than the small pox. It is confined only

The bowels should be kept gently open at this time, and swellings should be invited to the hands & feet when it falls in the face by warm water, poultices, and Blisters.

The matter should be discharged from the pock by opening them <sup>th</sup> with a Needle, when danger is apprehended from this number.

8 Linen sh<sup>d</sup> be often changed. Warm Bath useful when pock does not fall off readily.

For many facts of on this disease see Rushburn, History of Mead, & above both Thillay.

Vaccination is to be preferred to Inoculation, because it communicates a less violent disease, <sup>ch</sup> ~~it is never mortal~~.  
2 — it is not contagious. 3 It does not prevent work. 4 ~~it~~ <sup>after</sup> may be communicated at all seasons, and gives it to persons indisposed with other diseases. 5 It is never mortal.

In command: attend to things I never to take matter after 9<sup>th</sup> day. Dr Jenner calls this a gained boundary. 2 to vaccinate with a

I cannot dismiss this disease without  
taking notice that two errors have entan-  
-ched themselves <sup>in it.</sup> 1<sup>st</sup> that it was a  
specific disease and that its remote &  
proximate causes were exceptions to  
the Unity of Elements, and the Unity  
of disease. ~~This error I hope you have~~  
~~has no existence in this University. The~~  
~~is the offspring of the first & that is~~  
2<sup>d</sup> error is that the <sup>first</sup> ~~for all~~ prox form  
the specific nature of its remote cause &  
and proximate causes required unlike  
the Gout and Hydrophobia, certain  
specific remedies to cure it. The  
Remedies for this purpose have been  
Bered mineral, Saffron, Shapdurg,  
with many others and finally Mercury.  
But they have ~~all~~ all failed,

*[Faint, illegible handwriting in cursive script, likely a letter or manuscript page. The text is mostly obscured by fading and bleed-through from the reverse side.]*

of annihilating or subduing the disease, ~~like~~  
~~add~~ And after the ~~exp~~ researches & experience of  
ages, the illustrious Dr Sydenham <sup>first</sup> discovered that  
it was not to be cured, but that its mortality  
~~like the~~ was to be prevented by exactly  
the same remedies that mitigated <sup>in doing so he</sup> ~~it~~ <sup>fully</sup>  
the mortality of other fevers. ~~these~~ <sup>stimulus</sup> ~~remote~~  
Established the Unity of its ~~causes~~ <sup>stimulus</sup>  
and ~~proximate~~ <sup>the Unity</sup> of the deranged actions it  
produced in the blood vessels with the Unity  
of the stimulus and <sup>the Unity of</sup> the deranged actions  
which take place in all other fevers. The  
It will be only by  
~~It is~~ By, <sup>causes and</sup> ~~proximate~~ <sup>actions</sup> ~~specific remote~~  
that we shall, in like manner,  
ever bring them under the Dominion of  
medicine. ~~that~~ <sup>way</sup> ~~they never~~ ~~never~~  
can be cured <sup>in</sup> by any other ~~thing~~, not even  
by a ~~large~~ <sup>continued</sup> of Gout warts or Hydrophobic warts.

v. exposed, but not wholly prevented  
by inoculation. A new mode of  
preventing it with more certainty has  
been discovered by means of what is  
called Vaccination from the matter w:  
effects this resistance to the small pox  
being obtained from the teeder of the  
cow.

2  
~~as the~~ The malignant and fatal tendency of  
the small pox has for many years been  
I shall ~~now~~ deliver to you an epitome of  
all I have read, observed, and heard upon this  
~~subject~~ Vaccination - the remedy which  
~~has lately been introduced for the purpose of~~  
~~eradicating the small pox from the world.~~  
eradicating the small pox from the world.

1 That ~~matters should be performed~~ It may  
be performed upon all ages - and at all seasons.  
During the period of the first winter & during the  
winter, children are subject to other diseases for  
which reason some physicians decline perform-  
ing it at those times. <sup>It</sup> runs its course  
most rapidly in summer. It cannot be  
communicated when the  $\varphi$  is at  $90^\circ$ . Dr  
Adams says it could not be communicated  
during the blowing of a wind in India  
known by the name of the Leeste wind.  
There is a parallel fact in the small pox.  
It cannot be communicated during the

V heat and the Winds in these cases create  
a preponderating counter impression  
upon the skin.

V Cough in its declining state. I can  
subscribe in one instance to the truth  
of this remark. Mervin's (A?).

3  
blowing of the Hamattan Winds. — The

2 ~~Other diseases existing~~ It may be common?  
to persons labouring under various diseases  
of all kinds. ~~the it is stopped~~ <sup>some</sup> These eruptions  
particularly the itch resist it - but where  
the vaccination <sup>it succeeds</sup>, it sometimes removes those  
eruptions. It ~~has~~ <sup>succeeds</sup> ~~take~~ place in Scrophula,  
Cough and deafness, and has sometimes  
removed them. It has been the vaccine  
matter applied to <sup>an old</sup> sore in the nose to re-  
move it, a Physician in Calcutta has  
proposed to apply this matter to Cancerous  
sores in hopes of obtaining from it a similar  
good effect. It is said to arrest the progress of certain  
diseases. Dr. Anker says it destroys the creeping

3 The matter may be taken from a pustule  
or a scab. ~~The matter~~ <sup>It</sup> should be ~~taken~~ in the  
former case only in its watery state which  
is generally the case on the 3<sup>d</sup> & 4<sup>th</sup> days and

4

now it is so late as on the 20<sup>th</sup>. The matter  
is contained in cells so that several pictures  
with a lancet will be necessary to obtain the  
contents of a pusicle. ~~It~~ For this it differs  
from a pusicle from the small box. The  
matter may be taken on thread, or ~~between~~ <sup>on</sup>  
a piece of glass rubbed over the pusicle when  
opened, and then covered with glass of the  
same size. The glass should not be placed  
over it till its watery part, are evaporated.  
In this <sup>way</sup> ~~communication~~ is prevented in it, which  
destroys its infecting quality. It may be  
taken on the point of a lancet. I know this  
mode of taking it is objected to from the  
matter oxidizing the lancet, but it has never  
but once failed with me ~~when taken in~~  
this way. The matter should be moistened  
with cold water only when applied to the  
arm. The live matter that is used, & the

to communicate the disease, it sh<sup>d</sup>.  
be first scraped a little, & then broken  
into pieces & preserved between two  
pieces of glass. When used a portion of  
it should be taken from the glass and  
manipulated by itself. If we <sup>it</sup> are <sup>manipulated</sup> upon  
the glass and then cover it, it undergoes  
a change which destroys its infecting  
quality.

The canet sh<sup>d</sup> be held a few seconds under  
the article. <sup>In some experiments on the</sup> ~~Roller the part of the glass.~~ One  
horse was killed in ~~one hour & a half~~ by holding it  
for some time - Another recovered in 48 hrs.  
The canet was barely thrown in & taken  
out.

that is  
As blood is drawn the 5  
more certainly the operation succeeds. I  
have said impied matter sh<sup>d</sup> be used only.  
When purulent it induces a Puerperal Disease.  
The same thing occurs with the small pox,  
in which the inflamed sore are greater than  
from fresh matter. There of 5 persons in-  
culated <sup>by Mr Earle</sup> with old variolous matter who all  
took the small pox & took it afterwards,  
one of whom died. The matter for  
vaccination should be taken only from  
the pustule on the arm, & never from  
the best looking pustules in any other  
part of the body. When a scab is employed

& the pustule generally appears filled with  
matter ~~with a hollow in its middle~~ on the  
8<sup>th</sup> Day, but there are cases in which it has  
not appeared till the 12. 14. 18. 46 according to  
Mr King, 5 and 6 weeks according to others.

✓ The activity of the vaccine matter is some-  
times promoted by rubbing the arm before  
or after the matter is introduced in it, also  
by a generous diet. The latter often gives  
activity to a feeble infection from the small  
pox.

+ The same thing is true in the smallpox.

informed

~~The~~ Dr. Valentine of Marseille ~~applies~~ me  
in a letter I received from him ~~a few days~~  
<sup>of 4 years old</sup>  
~~on~~ Jan<sup>y</sup> 27. 1808 that in a child vaccinated by

M<sup>r</sup> Chevresse an Apoth<sup>y</sup> & Botanist attends  
the pustule did not appear till one year  
afterwards when it ran <sup>the</sup> its usual course of  
the disease. I believe ~~this~~ for have known  
an instance in <sup>the</sup> pustule from variolous  
~~matter~~ in <sup>the</sup> small pox by inoculation  
did not appear till 3 months after it was  
put into the arm. These facts ~~are~~ support  
the opinion of formerly taught of Variola  
= variola lying weeks months & even a  
year in the body before they produced a fever.

Can easily distinguish and Scab, a small Area  
a small pustule - ~~great itching~~ <sup>the matter of</sup>  
indicate a local ~~or a~~ disease. From this  
local disease, a true disease may be produced.  
- much itching, and the absence of, or a  
Scab - ~~and~~ <sup>great</sup> sores over the body,  
very small Cicatrix indicate <sup>of</sup> a  
disease.

The Vaccine pustule is distinguished  
 from the Variolous pustule by the following  
 marks. 1 It is divided into cells in which  
 the matter is contained. 2 It is depressed in its  
 center. ~~the scab~~ 3 The crust appears upon  
 it earlier than in the small pox. 4 There  
 is no inflamm<sup>n</sup> around the pustule on the  
 5<sup>th</sup> Day as there is in the small pox. 5. The  
 Vaccine pustule is single & independant, the  
 variolous pustule is often surrounded with  
 pustules that run into it. 6. The <sup>vaccine</sup> ~~variolous~~  
 pustule leaves a small circumscribed <sup>cell</sup>  
 & trip. The variolous pustule leaves a more  
 extensive - irregular cicatrix. 7 Vaccine  
 matter <sup>generally</sup> passes into a scab, & <sup>without much</sup> ~~scab~~ <sup>into pus,</sup>  
 the ~~vaccine~~ <sup>variolous</sup> matter <sup>constantly</sup> ~~passes~~ <sup>into</sup>  
 pus. 8 The Vaccine scab is smooth, hard,  
 semitransparent, of a dark brown color,  
 with its margin elevated. and in shape

There is more indisposition when the pustule  
appears on a late Day than on the 8<sup>th</sup> day.

§ V

The disease after ~~beginning~~ discovering its progress  
- sometimes suspended for several  
days, and then resumes its course. It has  
been suspended by the scarlet fever in one in-  
stance, & it prevailed over it in another  
related by Dr Jenner. You will understand  
the reason of this by reflecting one of the  
laws of Epidemics.

The system is ~~not~~ protected from the  
small pox, nor from any other disease  
before the appearance & inflammation of the  
pustule. They protect the system from  
other diseases, more especially if they are  
accompanied with a swelling, & in the  
arm - sometimes some painful fever. In  
these symptoms - ~~unusually~~ <sup>common</sup> - are sometimes

resembling the vesicle itself. The Variolous  
Scab is rough, scaly, friable, & greasy  
opaque - of a light brown color, and  
with its crests somewhat elevated. The  
effluence round the vaccine pustule is large  
and regular, and the skin hard under it. The  
inflammation round the Variolous pustule is in-  
faint - irregular, and often covered with  
minute confluent pustules.

8  
read of nausea - vomiting & even convulsions.  
They are I believe generally from taking  
or some more powerful disease than the  
vaccine.

10 It has been said that impregnating the  
system with helpster prevents the activity  
of the vaccine matter. <sup>It is a fact that</sup> of 88 persons who  
had been taking helpster for the Mch, but  
did not take the disease.

~~These eruptions~~ <sup>Consequently</sup> follow the vaccine  
~~disease~~ <sup>but</sup> ~~than the variolous~~. I believe that  
by no means so often as the small pox  
by ~~the~~ inoculation. Where these erup-  
tions are more copious than usual,  
Dr Patterson has ascribed them to a cutaneous  
constitution of the atmosphere disposing  
disease either to affect or pass out of the  
skin.

12 It has been said, that the vaccination

18

no interruption in business, or labor.

The clamors against it have been excited chiefly by ignorance and envy.

I know of no objection to it, but the difficulty of procuring & preserving matter, but these be obviated by <sup>the</sup> measures that ~~are~~ have been ~~is~~ introduced. Permit me to recommend <sup>it to your</sup> ~~the~~ practice, ~~it~~ in preference to various inoculations. Where it fails, suspect some latent disease, if the matter be good. - # of 20,325 who were vaccinated between Jan<sup>y</sup> 21. 1799 & Jan<sup>y</sup> 1. 1807 by Dr Adams 21 only took the natural small pox afterwards, two of whom only died. a greater number I believe take it after variolation. It is remarkable the small pox is generally favorable when taken after vaccination, & that the pox turn on the 6<sup>th</sup> day. It ~~was~~ did the same thing after variolation in Capt: Caper whose case you will see recorded in Dr Coxe's medical museum. Two cases more & their

does not always defend the system from  
 the small pox. I admit it. ~~But I~~ <sup>the same</sup> ~~was~~  
~~sure it is~~ <sup>the same</sup> thing is true of Variolous  
 inoculation, and that much often than  
 of Vaccination. Of this I could produce  
 many proofs in this city. It approaches  
 nearer to certainty in its effects than  
 any other remedy <sup>for</sup> ~~for any~~ disease in  
 the whole materia medica. ~~It~~ <sup>It</sup> has the  
 following advantages to recommend it  
 in preference to Variolation ~~inoculation~~.

- 1 It communicates a less violent disease.
- 2 It is never mortal. 3 It has never  
 been followed by lameness <sup>or marring face of</sup> of the face,  
 blindness, or consumption which has  
 been the case with Variolous inoculation.
- 4 It is not contagious. 5 It produces

produce ~~a severe attack of~~ small pox after both  
 Vaccination & Variolation 1. a strong epidemic  
 variolous  
 constitution of the atmosphere. Common fevers  
 are often tinged according to Sydenham by  
 some of the symptoms of the small pox in  
 such a state of the air. and 2<sup>d</sup> strong exciting  
 causes acting upon the system while it is im-  
 pregnated with the variolous <sup>matter of the</sup> disease.  
 This was the case in Capt. Capron.  
~~so to 10-13~~ . . . . . that

That the Vaccine disease affects the whole cuta-  
 =neous system in connection with the small  
 pox is evident from <sup>the following fact</sup> ~~two facts~~ 1 If a scratch  
 or wound be made upon the skin during the  
 progress of the Vaccine puncture, the scratch or  
 wound will ~~per~~ keep pace with & partake of the  
 nature of the inflamma<sup>n</sup> of the Vaccine pustule.  
 This fact was communicated to my friend Dr. J. J. J.  
 by Dr. Jenner. 2 ~~If a vaccine puncture~~ It shows  
 illustrates in the what I have called ectodermic  
 sympathy in a striking manner. <sup>so to 10-13</sup> . . . . .  
 the same thing occurs if the vaccine & variolous

Matter are inserted on susceptible days.

3. ~~Both diseases~~ The pustule in both diseases  
 ripens on the same day generally & deviates  
 from their common order in the same ~~less~~  
 manner as to the time of their ripening or  
 producing their respective disease.

4. The old matter is ~~an~~ apt to produce a  
 spurious disease in both cases.

5. A single <sup>pustule</sup> ~~pox~~ if small pox is as little  
 disposed to spread the disease by contagion  
 thro' the atmosphere as a pustule of the vari-

ous disease.

~~There they protect from the small pox.~~

[Departures from original diseases are  
 not uncommon. The <sup>Variolous disease</sup> ~~is~~ <sup>now</sup> mild dis-

ease compared with what it was 200 yrs  
 ago and yet they are less infectious  
 than formerly, & yet they are the same  
 diseases.

Variation has return to +

moderate ~~and~~ attacks of small pox after both  
 Vaccination & Variolation 1. a strong epidemic  
<sup>variolar</sup> insurrection of the atmosphere. Common causes  
 are often traced according to Sydenham by  
 some of the symptoms of the small pox in  
 such a state of the air. and 2. Strong exciting  
 causes acting upon the system while it is im-  
 pregnated with the variolous <sup>matter of the</sup> disease.  
 This was the case in Capt. Capon.

on <sup>the</sup> subject of vaccination.

Gentlemen,

In entering upon the <sup>first</sup> part  
 of this discourse, I feel as if I be-  
 lieved myself called upon to ~~split~~ divide a Ro-  
 man ignis vitæ in your presence.  
 - For viewing it in all its parts, and  
 direction, I can see both

Dr Adams has taken pains to prove that  
 vaccine disease is a kind of dwarf variolous  
 disease. The facts he adduces in support  
 of his opinion are as follows.  
 If vaccine matter be inserted in the arm & a  
 fresh puncture be made three days afterwards,  
 both issues on the same day. The same  
 takes place in the variolous inoculation  
 vaccine & variolous matter be inserted  
 the same day in different parts of the body,  
 both run their courses exactly together.  
 No thing seems if the vaccine & variolous

Matter are inserted on susceptible days.

3. ~~Both diseases~~ The pustule in both diseases  
 ripens on the same day generally & deviates  
 from their common order in the same ~~time~~  
 manner as to the time of their ripening or  
 producing their respective disease.

4. The old matter is ~~an~~ apt to produce a  
 spurious disease in both cases.

5. A single <sup>pustule</sup> ~~pustule~~ if small & is as little  
 disposed to spread the disease by contagion  
 thro' the atmosphere as a pustule of the Vac-

cine disease

~~From they protect from the small pox~~

[Departures from original diseases are  
 not uncommon. The <sup>Vent</sup> diseases are now  
 milder <sup>cases</sup> ~~are~~ mild dis-

cases compared with what is was 200 yrs  
 ago and yet they are they are less infectious  
 than formerly, & yet they are the same  
 Diseases.

Vaccination has return to +

— From the history I have given of  
 Vaccination, you will perceive that it  
 requires more knowledge - judgment and  
 prudence to communicate the genuine  
 Disease, ~~than by~~ so as to protect the  
 System from the small pox, than it  
 does to do the same thing, by Variolation.  
 I ascribe most of the failures in com-  
 municating <sup>it</sup> to ignorance or inattention  
 to the various circumstances <sup>wh</sup> should  
 govern its practice in it. I have the  
 most unshaken confidence in its <sup>general</sup>  
 certainty, ~~and thus~~ I consider it as  
 one of the greatest blessings Heaven has  
 conferred upon the health & life of man.  
 no vaccinated medical student who  
 had been vaccinated, took small pox in 1809  
 - 1811.      so to measles &c.

have lately obtained over a ~~more~~ <sup>the most</sup> ~~of all~~ <sup>of all</sup> fatal diseases, we are led to ~~anticipate~~ <sup>anticipate</sup> the time when, ~~they shall both~~ <sup>they shall both</sup> Reason and ~~humanity~~ <sup>humanity</sup> shall enjoy an equal triumph in the annihilation of pestilence from our globe. It belongs almost exclusively to the physicians of the United States to have pointed out the means for this purpose. How long the time may be before the time will come when the names of Webster, Mitchell & Caldwell How long the time may be before this event will take place I know not, but I believe it is <sup>as</sup> much out of the power of prejudice, error, interest

~~Dr Watson has taught us how much~~  
it is varied by the state of the Atmosphere.  
- He describes to be calls "a putrid  
measles" in London. They were ~~nothing~~  
~~but the~~ produced by an ~~excess~~ in the  
✓ Stimulus of the Contagion. From w:  
you heard of the <sup>12</sup> primary states of  
fever, you can never be at a loss how  
to treat them. For the most part the  
pulse is Sympcha. & Sympchula <sup>or</sup> ~~or~~ <sup>rather</sup> ~~or~~ <sup>rather</sup>  
& typ<sup>d</sup> & typhus. In reading ~~any~~ <sup>the</sup> histories  
had been vaccinated, 1000 per cent.  
- 1844. So to measles. 1844.

& make to prevent it as it is to  
 prevent the change of the seasons, or  
 the <sup>annual</sup> revolutions of our globe around  
 the Sun  
of the unceasing

I refer you to books for a history of  
 this disease. — the best acc<sup>t</sup> of it is to  
 be had in the history of Epidemics. I shall  
 give you a short acc<sup>t</sup> of them as they  
 have lately appeared in this city viz in  
 1801. & 1802  
 They made their first appearance in  
 the south end of the city in the month of July.  
 and were stationary there until Decem<sup>r</sup> when  
 they gradually spread thro' the whole city.  
 observe here i. their gradual progress, & 2<sup>d</sup>  
 their increase with cold weather. How  
 different from the manner in which

I have given  
of it as it has appeared in Phlegm<sup>a</sup>  
in different years, I beg you would take  
notice of the amount I have given of a  
spurious kind of measles - or a morbillous  
fever which does not protect from a  
2<sup>nd</sup> attack of the disease. It is a superficial  
affection, analogous to the cuticular  
smallpox which I have described in the  
1<sup>st</sup> vol. of my inquiries. I shall dismiss  
this disease with a few general remarks.

go to p. 18. =

had been vaccinated, 1000 years ago

- 18th.

go to measles/18th.

15  
Those diseases spread which are derived from  
an impure atmosphere. They spread in  
a few weeks thro' whole cities & countries,  
and are always checked by cold. —

The following circumstances occurred  
in the symptoms of this Epidemic in my  
practice.

1 The disease wore the form of the  
anthemial fever in the following symptoms  
i It was strongly marked by Remissions  
& Intermittions. The exacerbations occurred  
chiefly in the night.

2 There was in many cases a <sup>constant</sup> ~~great~~  
~~deal of~~ nausea & discharge of Bile by  
voming. —

3 I saw one case of in which they app?  
with a violent cholera morbus.

4 Several cases of Diarrhoea & of Dysentery  
occurred in my practice.

✓ Eruption after a very dry.  
a salivation.

Two more

1754.

So to me as a whole.

II many severe cases of pleurisy & two of  
 Cynanche trachealis appeared with the  
 measles. ~~no~~ ~~for~~ ~~the~~ ~~measles~~ -

III a discharging sore mouth followed the  
 measles in one of my patients, a child  
 under 2 years old.

IV a fatal hydro: inter: followed the  
 disease in a child of 8 years old that  
 had been treated for worms.

V ~~The~~ I saw one case in which the  
 eruption did not take place till 10, or  
 another 14 days after the fever came  
 on. —

VI Two children had eruptions like  
 smallpox before the eruption of the  
 measles.

VII many children had coughs ~~severe~~ <sup>watery</sup>  
 eyes for several days, but without the  
 measles. The same children had them

~~To this history of the Epidemic I shall now~~  
~~add a few general remarks.~~

1 Dr. Willan says he had seen a case in w<sup>ch</sup>  
 the measles were taken twice. In this ~~to~~ case  
 he probably mistook the spurious measles for  
 the morbillous fever for the genuine measles.  
 He says Acc<sup>t</sup> of them in the 2<sup>d</sup> vol of my inquiries.  
 They are now admitted by several writers, viz  
 Dr. Wilson

2 The Dr. says he has seen two successive eruptions,  
 as in the small pox.

3 He describes two cases which ran their courses  
 without any Catarrh. You see here gentl<sup>y</sup> the  
 Unrest? of relying upon pathog: Signs of diseases. The  
 is scarcely any disease ~~to~~ which this affords signs that  
 deserve that name.

4 It is said the small pox & measles occur at the  
 same time in the same person. They do so, but  
 the actions & eruptions excited by them I believe  
 are always in succession to each other.

5 It is often <sup>accompanied or</sup> followed by a distressing Diarrhea, or

Truths afterwards! see my list of opinions  
Measles in mid. Eng. & S. Eng.  
will many people ~~that~~ who had had  
the measles had coughs resembling the  
morbillous cough.

IX The Remedies  
1 were used from 3 to 1360.

2 Laxant purges - 3 Demulcent Drinks.

4 Opriates at night and abstinence  
where a Diarrhea took place. 5 Phlebotomy.

I saw evident advantages from order-  
ing a vegetable diet after it appeared  
in several families.

I lost but 1 patient in this disease,  
viz a child in fits. — much more  
successful than in former years only be-  
cause I bled more freely. — 

Cough. They are both cured by V. & the  
other remedies for these diseases.

No <sup>satisfactory</sup> reason has ever been given why  
the small pox & measles are ~~so seldom~~  
taken but once, or why either of them  
is ever taken twice - Time I hope  
will furnish an explanation of this  
wonderful operation of nature in the

human body. It is remarkable that both these diseases in  
is generally upon a footing <sup>the</sup> in both these diseases in  
the measles  
occuring but once in life. The remedies for <sup>the</sup> ~~the~~ be according  
- dictated to the state of the pulse & of the lungs. They  
shd be 1 V. from  $\frac{1}{4}$  to  $\frac{1}{2}$  2. Slight purges.  
3. Disinfectants drinks 4. Opriates. <sup>5. Blisters.</sup> If a Cough  
succeed - V. - If a Diarrhoea succeed the  
same remedy if the pulse be active. It  
yields to no other remedy. It is if I may  
be allowed the expression - a Cough in the  
bowels. Sydenham first recommended this  
remedy for the Diarrhoea which  
succeeds measles.

Erisipelas state of fever <sup>called</sup>  
also St Anthony's fire.

- 1 It belongs alike to Adults & children.
- 2 It is very apt to recur where it <sup>has</sup> ~~been~~ <sup>previously</sup> been affected. It is induced by many  
poisonous substances - as Cashew nut - Vine &c.
- 3 It affects the face, breasts in females,  
and limbs. I have twice seen it in the  
upper limbs after tapping for ascites.
- 4 It is the precursor of psoitential  
disease. It was, Dr. Hishoborn says of  
the yellow fever at St. Croix. It appeared  
only among the natives of the Island, from  
which it is probable it was a mild  
form of the Epidemic <sup>which</sup> succeeded it.
- 5 It now & then ends in mortification <sup>Death by</sup> of  
the part affected, or by translation to  
the brain. Dr. Bayard's case.

Dr. Sydenham has taught us  
✓ These more effectually prevent gan-  
-grene than any other remedy. But  
if gangrene has begun, to which it is  
disposed, Bark - wine should be given  
in liberal quantities.

Dr. Willan tells us it may be communic-  
-ated by inoculating with the water  
contained in the vesicle of the disease.

## Remedies

1. ~~Copious~~ vs. copious when indicated by the pulse, or state of the skin.
2. pruritus. 3 Blisters <sup>to the inflamed parts.</sup> 4 Cool Air.
- <sup>oily & Saturnine</sup> All Repellents to be avoided. flower the best remedy. —

milinary fever

Generally  
An Artificial disease from the hot  
Regimen. now scarcely known. It  
appeared in a milary fever at Mantua. Russia.

Chicken pox

<sup>little or</sup> known, by no previous fever &  
by few eruptions seldom more than  
200, appearing more on the back  
than upon any other part of the body.  
Cure. a puff.
